

Logistics Management System for Shohnaat

Everything you need to run your deliveries — pickups, parcels, riders, and the money that comes with them.

Prepared for Shohnaat • August 2026

1 Overview

Shohnaat moves a lot of parcels every day, and running that takes real coordination. This proposal is about putting it all in one clean system — so orders don't slip through the cracks, every parcel is easy to track, and the money always adds up at the end of the month.

2 Core Features

Here's what the system does, in plain terms:

Customers & Merchants

- Register and manage customers and merchants
- Custom shipping prices by service & region
- Payment methods, settlements & account statements

Pickup & Shipment

- Pickup request registration & tracking
- Rider assignment & automatic delivery lists
- Warehouse receiving, sorting & transfers
- Returns and rejected shipments handled

Delivery Representatives

- Rider registration & mobile task list
- Cash collection tracking
- Advances & commission payments

Tracking & Notifications

- Real-time shipment visibility
- Status history for every parcel
- SMS & email alerts on status change

Merchant Integration

- Connect merchant websites
- API-based shipment creation & status checks
- Real-time data synchronization

Accounting & Finance

- Delivery charges & collections
- Paid / due tracking & invoices

- Settlement statements & financial reports

3 How a Parcel Moves

Here's what happens to a parcel after someone books it:

4 The Critical Workflow

This is the journey every parcel takes — and who's responsible at each point:

Not every delivery goes smoothly, and that's covered too: a **Failed** attempt (with the reason noted), a **Cancelled** order, or a **Returned** parcel that goes back to the merchant. All of it is tracked, so nothing just vanishes.

Why this matters: each step sends the customer an automatic update, so your staff isn't on the phone all day answering "where's my parcel?". And every change is time-stamped, so you can always look back at a parcel's full history.

5 Why This Design Works

A system like this stands or falls on the choices made early on. Here's the reasoning behind ours:

No parcel gets lost

Every parcel has a clear status from start to finish. If something is late, stuck, or delivered, you'll know — and so will the customer.

The money always adds up

COD, fees, and payouts are recorded against each parcel as they happen. What the system says at the end of the day matches what's actually in your hands.

One system, four different views

Customers see their parcel, merchants see their sales, riders see their tasks, and you see the whole operation. Everyone gets what they need, without the noise.

Built for riders on the road

Riders work from the road, not a desk. Their screens are made for a phone — quick to read, one tap to confirm.

Built to grow with you

We add features in stages. When you're ready for the next step, it fits on top of what's already working — nothing gets rebuilt from scratch.

A record of everything

Every status change and payment is logged. If a question ever comes up about a parcel or a payment, the answer is in the history.

6

Security & Reliability

Your data and your merchants' money matter too much to be an afterthought. Security is part of how we build — not something bolted on at the end.

Everyone sees only what they should

An admin sees the whole operation. A customer sees their own parcels. A rider sees their own tasks. No one can look at anything else.

Security is the default

Passwords are encrypted, every page runs over HTTPS, and merchant connections use secure keys.

Backed up every day

Backups run automatically every day, and we actually test restoring them — so a disaster never means starting over.

A full audit trail

Every action is recorded with a timestamp. If a dispute ever comes up, the complete history is right there.

Tested before you use it

Nothing gets handed over until it's been tested — and then tested again with your real workflow.

Payments you can trust

Online payments go through PayPal or Stripe — the same processors trusted by millions of businesses. We never touch card details.

7 A First Look — What You'll See

These are real screens, not drawings — the actual pages your team and customers will use every day. Use the tabs at the top to switch between the screens, the technical scope, and a live simulation.

These aren't concept drawings — they're the working screens. When Phase 1 starts, we'll run the system live with your data: create an order, send a rider, deliver a parcel, and watch each update happen in front of you. You don't have to take our word for it — you'll see it working, and you can check every screen yourself as we build.

HOW IT'S BUILT

**Customers****Merchants****Admin****Riders**

▼ HTTPS · secure login · role-based access

**One application — four views**

▼ encrypted connection

**Your data — daily backups, tested restores**

▼ automated jobs

**Automation bots — SMS/email alerts · scheduled reports · data sync**

▼ secure outbound only

**SMS / Email****PayPal / Stripe**

SECURITY

- ✓ Everyone sees only what they should
- ✓ Passwords encrypted, HTTPS everywhere
- ✓ Backups every day — restores actually tested
- ✓ Full audit trail with timestamps
- ✓ PayPal / Stripe — we never store card details

FRONTEND

Next.js

Tailwind CSS

BACKEND

Node.js

Python

DATA & OPS

PostgreSQL

Prisma

Redis

Docker

JWT Auth

HTTPS / SSL

Automation is built in — bots send status alerts, generate reports, and keep merchant data in sync, so routine work runs on its own.

Status: Booked**▶ Play****↶ Reset**

The parcel is booked and has a tracking number.

8 Phase 1 — What's Included

We start with the part your team will actually use every day.

- ✓ Secure logins for Admin, Customers, and Riders
- ✓ Customer & merchant registration and management
- ✓ Pickup request — create, approve, and assign a rider
- ✓ Shipments with automatic tracking numbers
- ✓ Full status flow: pending → picked up → in transit → out for delivery → delivered
- ✓ Rider dashboard on mobile — tasks, confirmations, and COD entry
- ✓ Public tracking page with shipment history
- ✓ Deployed on your own server with daily backups

Phase 1 is delivered in about 2–3 weeks — a working system, tested and ready for your team to use.

9 Beyond Phase 1

Your business won't stay the same size, and the system shouldn't either. When you're ready, we can add:

- ✓ Smart pricing by zone and service
- ✓ Merchant website & API integration
- ✓ Multi-branch operations and routing
- ✓ Complaint desk, commissions, and partial deliveries
- ✓ Advanced reporting and full accounting
- ✓ GPS tracking and online payments (PayPal / Stripe)

We'll plan and scope these together, one at a time, when the time is right.

10 How We Work

You're hiring a team, not just buying software. Here's what working with us is like:

One project at a time

While we're on your project, it gets our full attention. We don't juggle several other clients at the same time.

You see everything

You get regular demos of working screens — real screens with your data, not slides.

Clear scope, no surprises

We agree on what's in each phase, and you approve it before we build. Nothing extra sneaks in, and nothing you asked for gets skipped.

Built around your work

We build around how you actually operate — your routes, your riders, your customers. Not a generic template.

Documented and explained

Your team gets plain-language documentation and hands-on training. The system is yours, and you should never feel locked out of it.

We stay around after launch

After each delivery we stay available — to fix issues, tune things, and answer questions as you grow.

Under the hood: the frontend is built with Next.js, and the backend runs on Node.js and Python — including automation bots that send notifications, generate reports, and handle routine jobs on their own. Proven foundations, fast and secure, ready to grow with your volume.
